Biomethane Potential

A scalable, market-ready drop-in solution
for immediate maritime defossilization

Alessandro v. Arco Gardemann
Chairman of the Board of
ABiogas

IMO Technical Seminar on Methane-Based Fuels
IMO Headquarters, London

12/05/2026

STRATEGIC OBJECTIVE

POSITION BIOGAS AND BIOMETHANE AS A VECTOR OF ENERGY TRANSITION IN BRAZIL, VALUING THEIR ATTRIBUTES AND PROMOTING MARKET ACCESS.

ASSOCIATED COMPANIES

POSITION BIOGAS AND BIOMETHANE AS A VECTOR OF ENERGY TRANSITION IN BRAZIL, VALUING THEIR ATTRIBUTES AND PROMOTING MARKET ACCESS.

The United Biogas Alliance (UBA) is a coalition of leading biogas associations working together to grow biogas markets and the multiple benefits biogas systems provide.

Why Coordination Is Necessary?

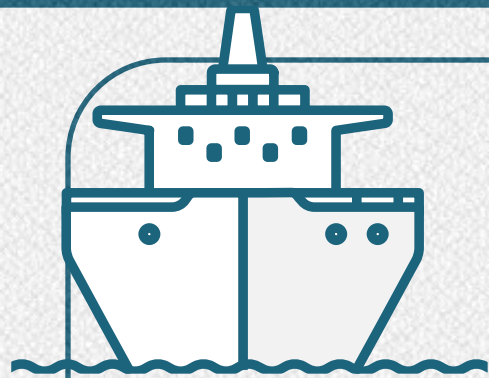

- Biogas systems are inherently decentralized. National coordination helps optimize supply chains and local policy to maximize organic residue recycling.
- International coordination elevates biogas markets, aligns carbon accounting principles, strengthens international recognition, and helps fuel marketers access buyers and sellers beyond borders, helping capital flow more predictably into these long-term infrastructure nodes.

Agenda

- Biomethane context
- Brazilian potential and global context
- Reduced emissions from biomethane
- Technology & market
- Closing

Biomethane context

2,400+

LNG-capable vessels globally¹
(in operation or on order)

Up to
80%

WtW GHG Reduction²

Near-zero emissions
(negative emissions possible with avoided emissions)

25.9 Mt/year

Bio-LNG potential from agro-industrial residues in Brazil³

8.4 Mt/year

Could already be supplied by Brazilian biomethane target production by 2030

56% of the global LNG market size by 2030⁴

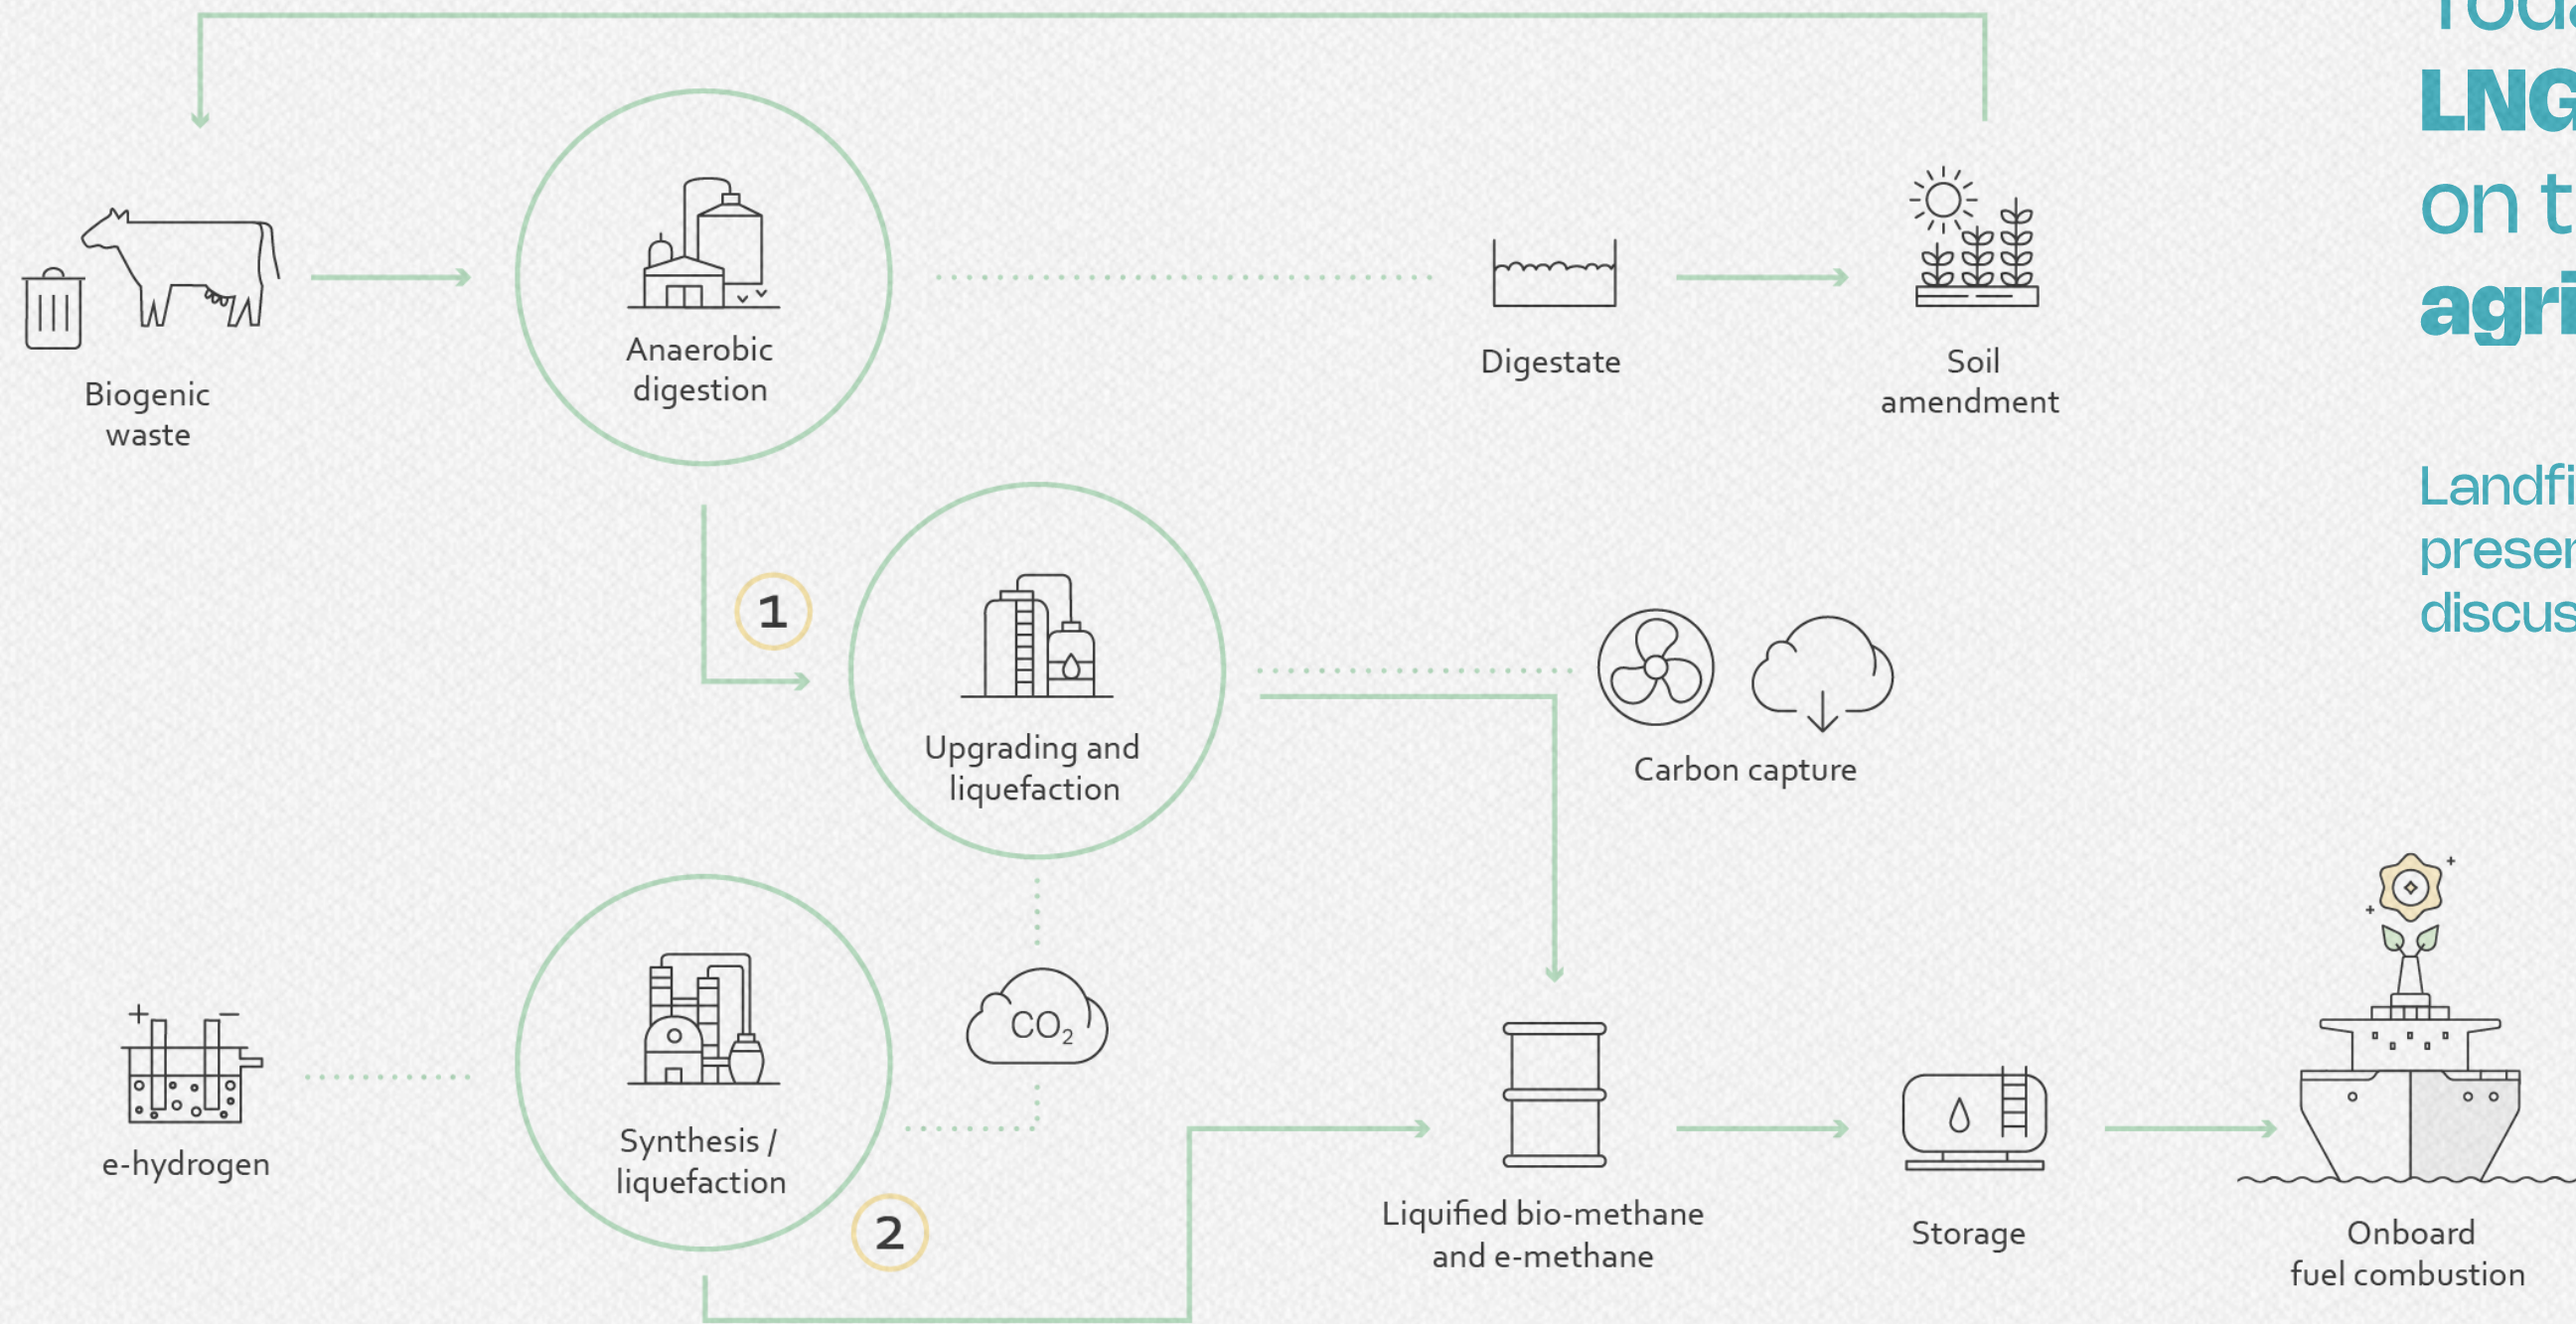

Can be supplied by the Brazilian biomethane target production by 2030

+38% of global maritime low-GHG methane demand by 2040¹

Can be supplied by Brazil's low-GHG bio-LNG

The LNG fleet is **already compatible with bio-LNG** — the question is supply.

Source: ¹ "Methane in shipping: LNG-fuelled ships and the switch to low-GHG methane" report from DNV, ² "Life Cycle GHG Emission Study on the Use of LNG as Marine Fuel" report from Thinkstep on behalf of SEA-LNG, ³ ABiogás estimative, ⁴ "THE JOURNEY: A Decade Moving Towards A Cleaner Future" report from SEA-LNG

Today, we will focus on **bio-LNG¹** – specifically, Route 1 on the left, produced from **agricultural residues**.

Landfill biogas is not covered in this presentation; only anaerobic digestion will be discussed.

¹Also known as liquefied biomethane (LBM); in some places, biomethane is known as renewable natural gas (RNG)

Brazilian potential and global context

SUGARCANE

Raw material

782 Mt

39% of world production

CORN

Raw material

132 Mt

10% of world production

LIVESTOCK

Heads

238 M bovine

15% of world production

44 M swine

5% of world production

MAIN RESIDUES

**VINASSE, FILTER
CAKE, BAGASSE,
AND STRAW**

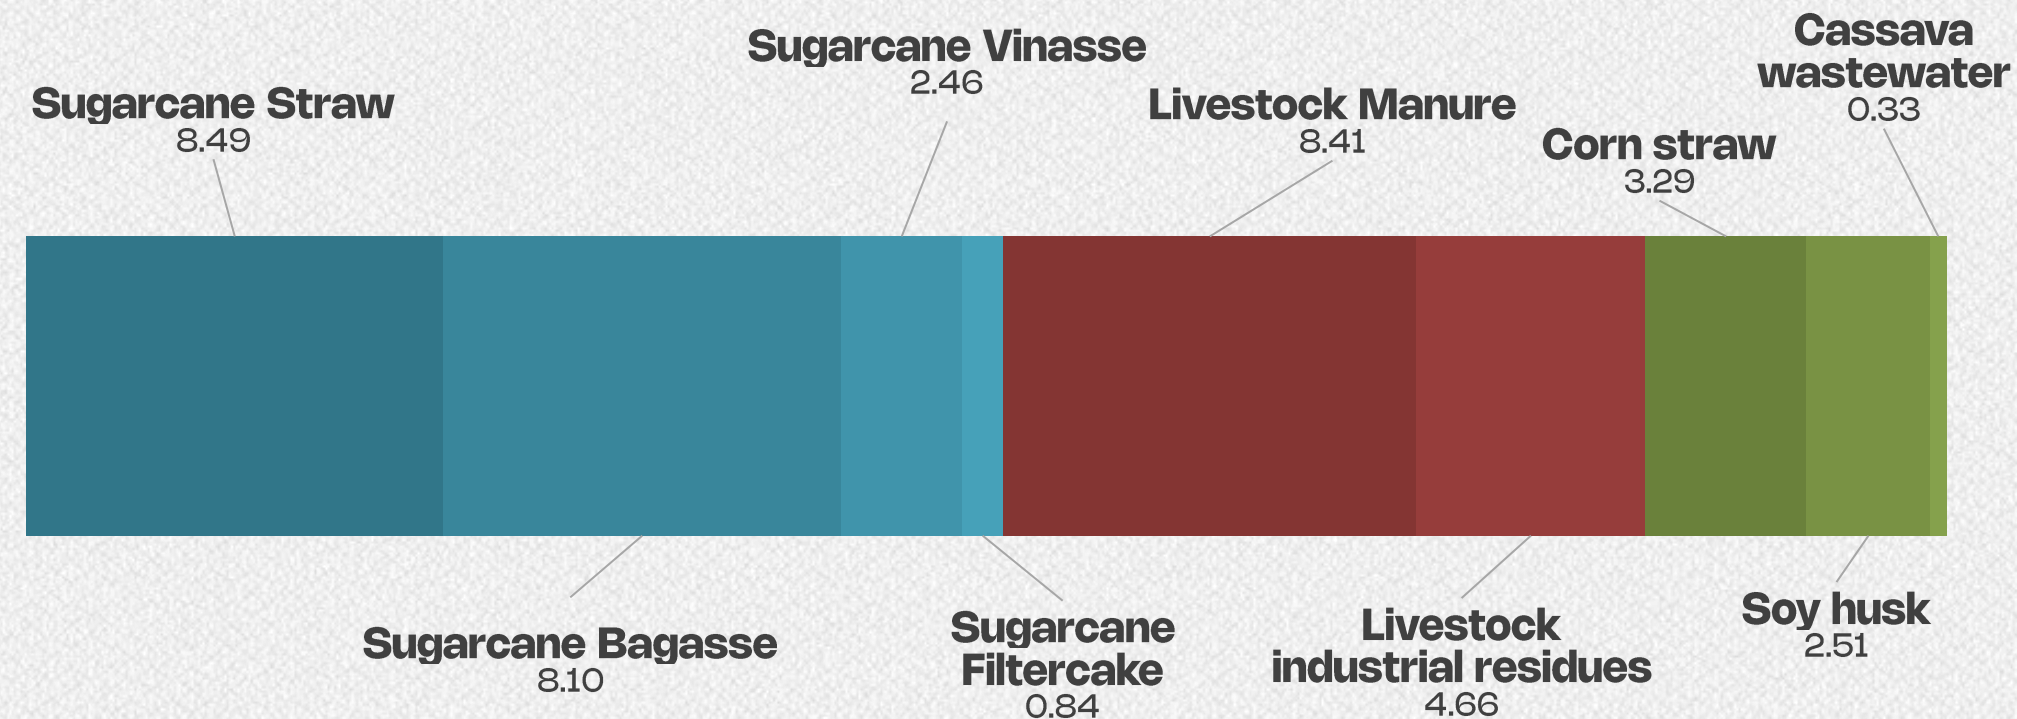

STRAW

**SLURRY/MANURE
AND PROCESSING
RESIDUES**

OTHER AGROINDUSTRY WITH RELEVANT BIOGAS POTENTIAL INCLUDE COFFEE, SOY, AND CASSAVA

Brazil's **biomethane** potential¹ from different **agricultural residues**.

In billion Nm³/year.

Total potential

39.1

billion Nm³/year

This **biomethane** can be liquefied into

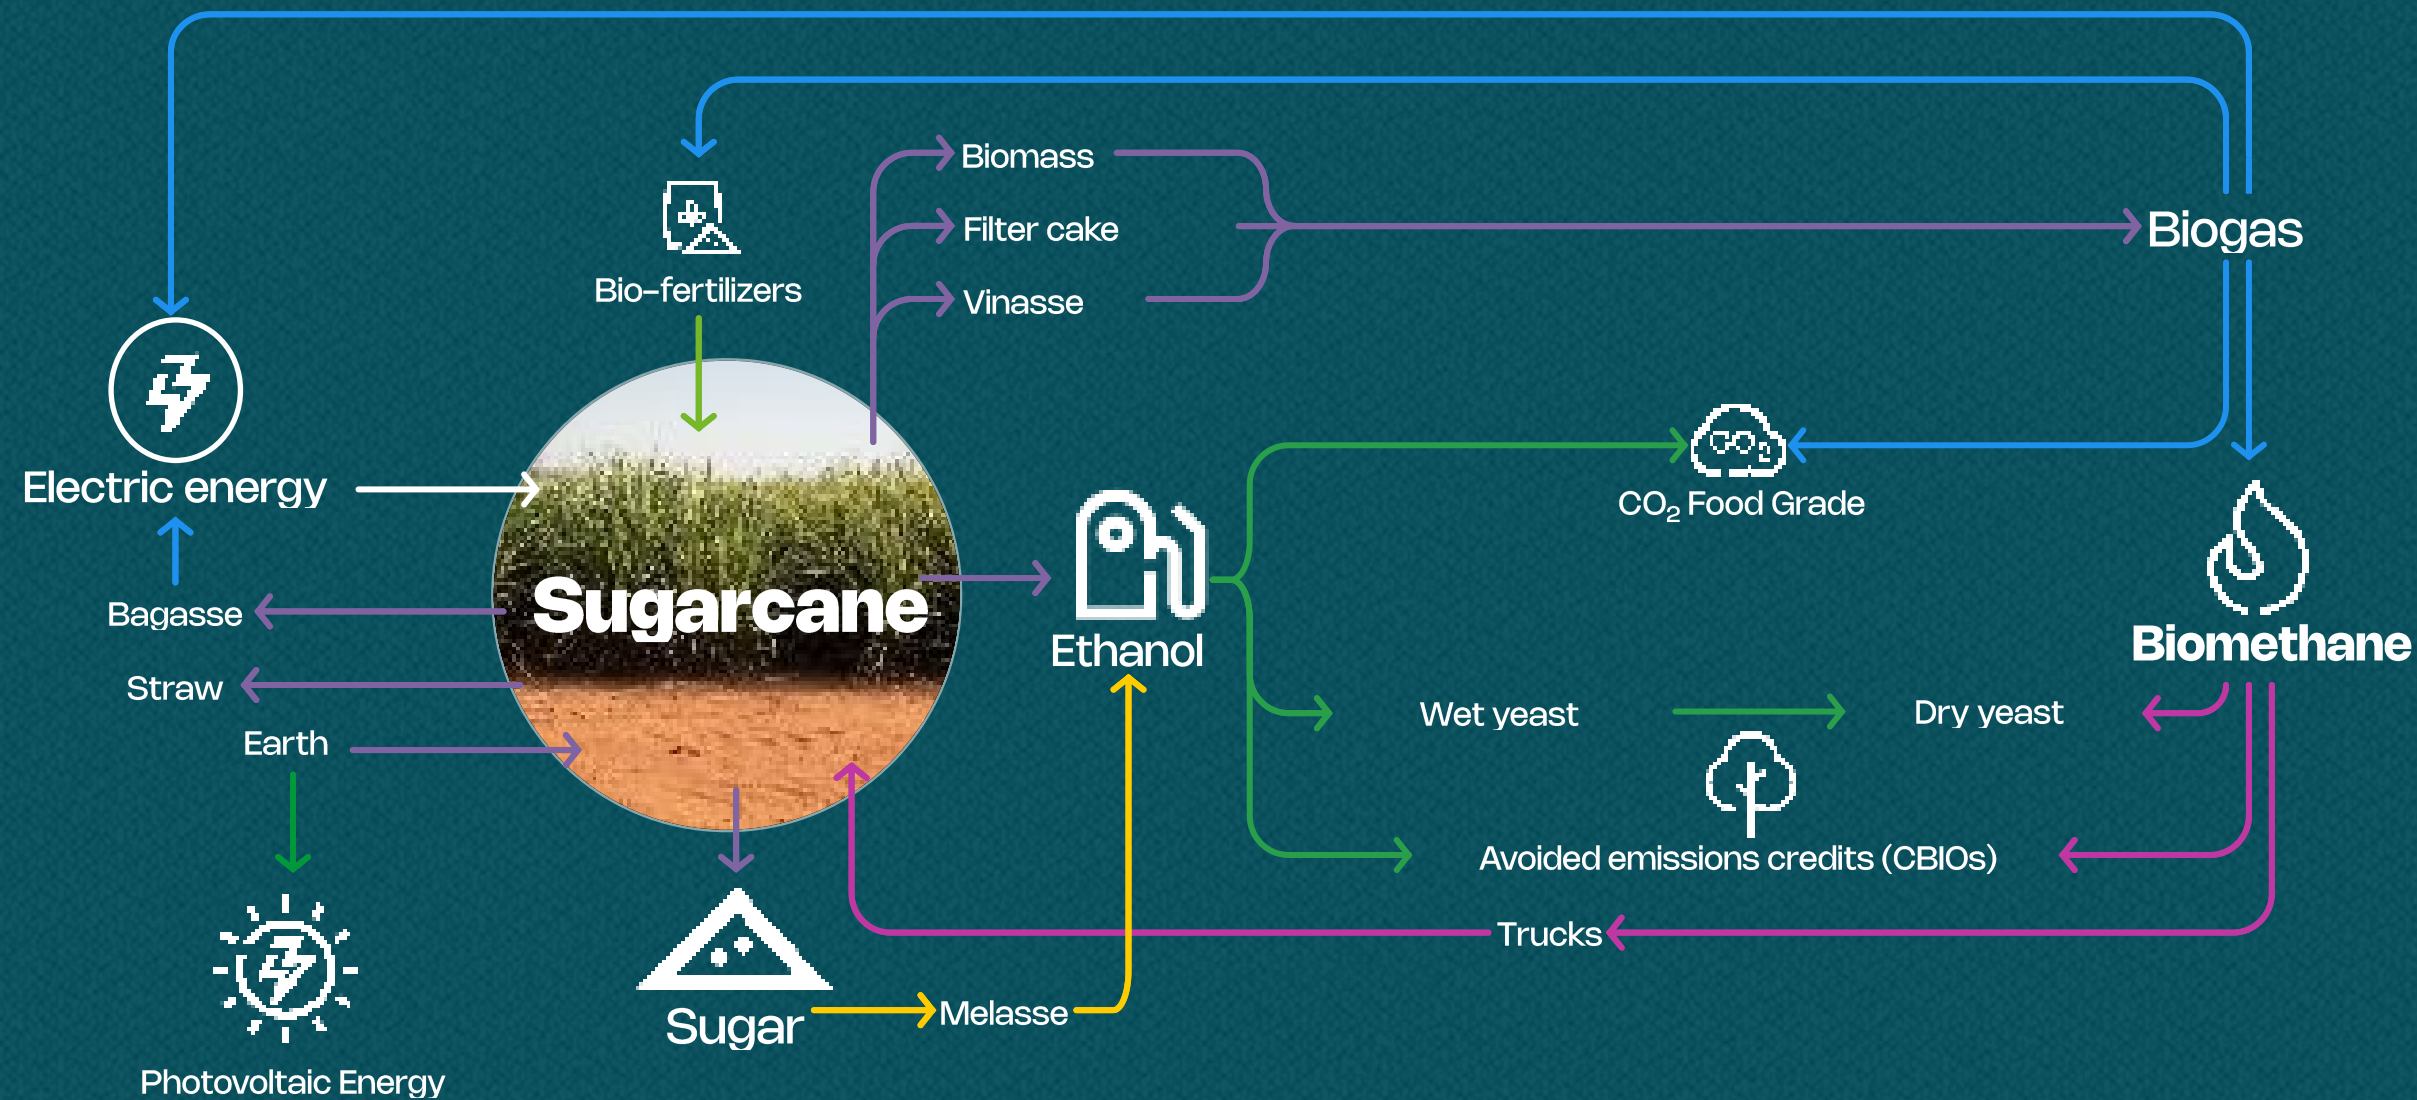

25.9 Mt of bio-LNG

per year.

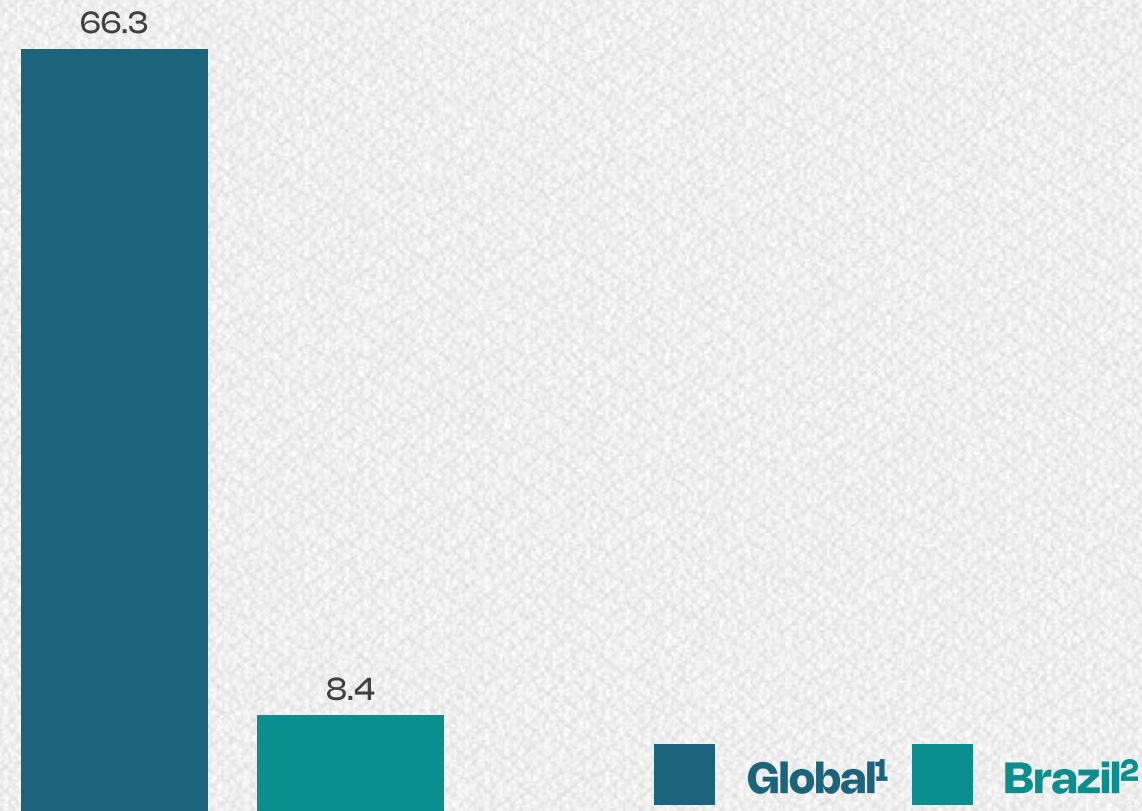

More than 50% of the global maritime low-GHG methane demand by 2040 – estimated at 40 to 95 million tonnes per year² – could be supplied by Brazilian bio-LNG from existing residues, with no need for additional cropland.

Source: ¹ABiogás estimative, ²"Methane in shipping: LNG-fuelled ships and the switch to low-GHG methane" report from DNV

Sugarcane industry example

The sugarcane industry represents one of the largest biogas potential sectors, enabling **circular economy solutions** through efficient carbon capture, integrated logistics, and nutrient recycling.

Biomethane **production target** by 2030 in Mt/year of bio-LNG

The Brazilian biomethane production target for 2030 can supply up to **8.4 Mt/year** of bio-LNG.

This is 32% of Brazil's bio-LNG potential, which can be unlocked through **regulatory incentives**.

Brazil's Fuel of the Future Law

Starting in 2026, the natural gas industry is required to purchase biomethane³ corresponding to a percentage of its production.

By 2036, the regulated market alone will require more than 2.7 Mt/year of bio-LNG equivalent.

Maritime

The maritime sector could enable the scale-up of the biomethane projects, securing long-term contracts with bio-LNG that is cost-competitive with the European market.

³The mandate can be fulfilled with physical biomethane with CGOB, the Brazilian government biomethane certificate of origin, or only the CGOB. It is an internationally fungible certificate, validated by the Brazilian National Agency for Petroleum, Natural Gas, and Biofuels (ANP).

Source: ¹"Global Biomethane Market – 2025 Assessment" report from CEDIGAZ, ²ABiogás estimative

Reduced emissions from biomethane

UPSTREAM

Residues carry **no cultivation emissions**

Those are attributed entirely to the primary product and coproducts (sugar, ethanol, meat)

AVOIDING METHANE EMISSIONS

Controlled digestion **prevents uncontrolled methane release**

Depending on the framework, avoided emissions can lead to negative WtT carbon intensity values

BIOGENIC CO₂

Carbon dioxide released during combustion is **biogenic**

Counted near zero in the WtW balance under multiple LCA guidelines

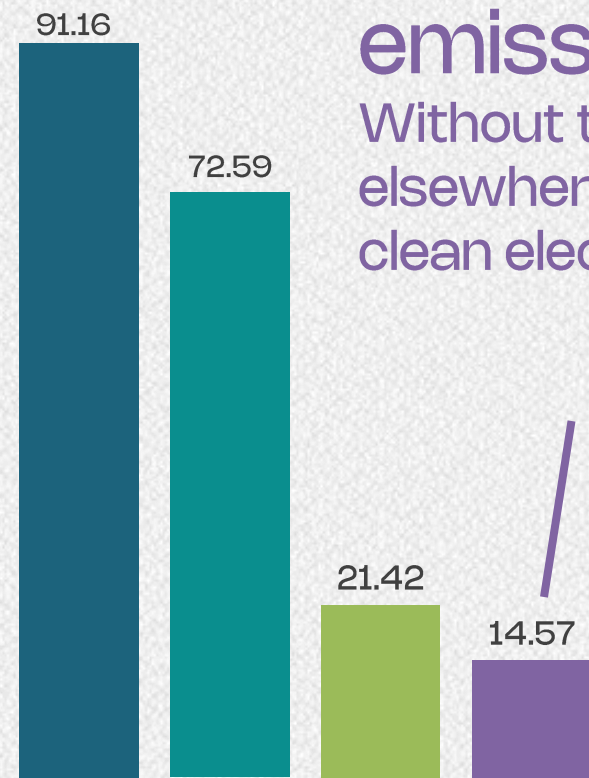

WELL-TO-TANK (WtT)

TANK-TO-WAKE
(TtW)

The Brazilian **bio-LNG** have **32% less WtW emissions.**

Without the carbon penalty seen elsewhere, thanks to its uniquely clean electricity grid.

WtW emission factor
in g CO₂-eq/MJ

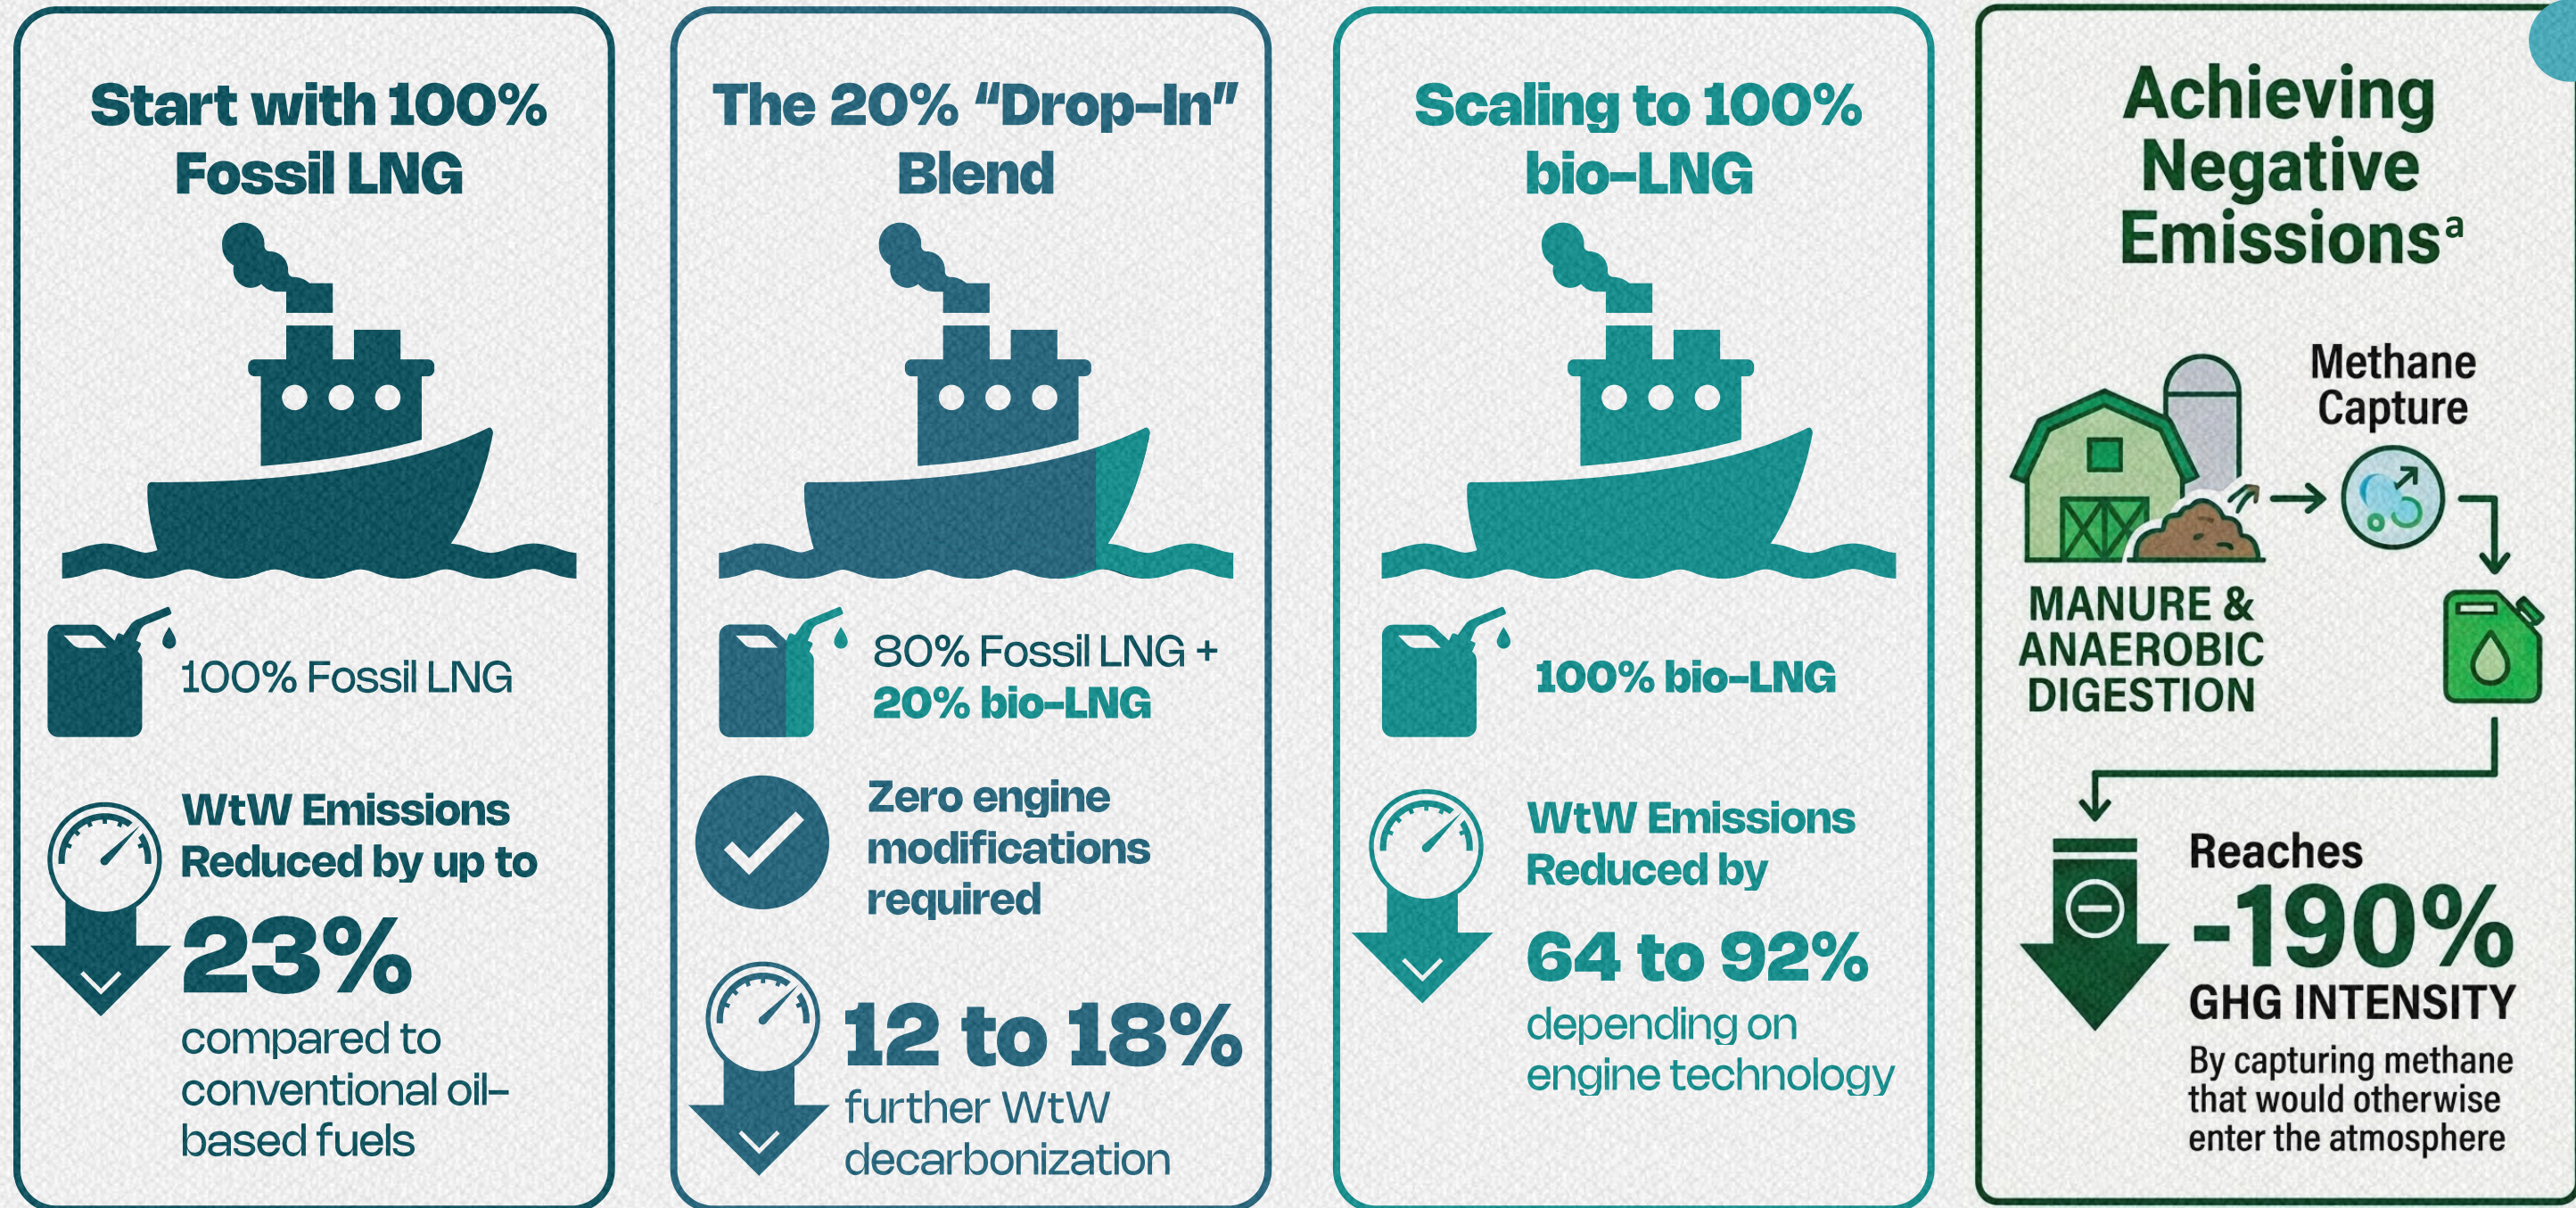

Fossil LNG has a lower carbon intensity (CI) than Heavy Fuel Oil (HFO), which can already help meet current **emission reduction targets.**

As emission reduction targets tighten and bio-LNG supply grows, it can be blended with LNG - **up to 100% bio-LNG - to achieve negative emissions.**

No ILUC emissions concerns when using residues.

Source: ¹ "Biogas as a Source of Biofuels for Shipping: Biomass Availability" Report from Mærsk Mc-Kinney Møller Center for Zero Carbon Shipping (MMMCZCS), ² "Methane in shipping: LNG-fuelled ships and the switch to low-GHG methane" report from DNV.

³ The value of 21.42 g CO₂-eq/MJ reflects a conservative estimate for WtW emissions associated with low-carbon methane in 2-stroke high-pressure dual-fuel (2-S HPDF) engines, as reported by DNV in "Methane in shipping: LNG-fuelled ships and the switch to low-GHG methane". For the same HPDF technology, the NZF scenario defines a range starting from a "Low" estimate of -18.58 g CO₂-eq/MJ highlighting the significant decarbonization potential of waste-based biomethane. ⁴ The WtT emission factor is based on the Brazilian Renovabio carbon intensity for biomethane from agricultural residues and includes the liquefaction emissions based on the Brazilian energy matrix. Other assumptions are based on 3.

Blending bio-LNG with fossil LNG progressively **lowers the overall carbon intensity of the fuel on a full life-cycle (Well-to-Wake) basis.**

Using LNG and bio-LNG blends allows shipowners to leverage existing investments while extending their compliance window as maritime regulations tighten.

^aOnly if avoided emissions or emissions credits are considered in the framework.

Technology & market

PRODUCTION

Anaerobic digestion and upgrading are mature, bankable technologies with thousands of plants globally.¹

Methane liquefaction is a proven technology; once impurities are removed from biomethane, the process is even simpler than for natural gas.²

Fossil LNG infrastructure can be fully leveraged; bio-LNG is fully drop-in compatible with LNG, so no changes to the infrastructure are needed.³

Brazilian Electricity Matrix is more than 90% renewable; high-energy steps like liquefaction can be low-carbon and advantageous for the final carbon intensity of the bio-LNG, compared with other international producers.

Source: ¹"Global Biomethane Market – 2025 Assessment" report from CEDIGAZ, ²"PNBB – Programa Nacional de Biogás e Biometano" report from ABiogás, ³"Biometano: combustível verde" from GEF Biogás Brasil

VESSEL SIDE

No retrofits required for existing LNG dual-fuel fleets.^{1, 2} Same tanks, same engines, same bunkering infrastructure.

Methane slip has been reduced by up to 90% over the past few decades^{2, 3, 4} through improvements in engine design and electronic controls.

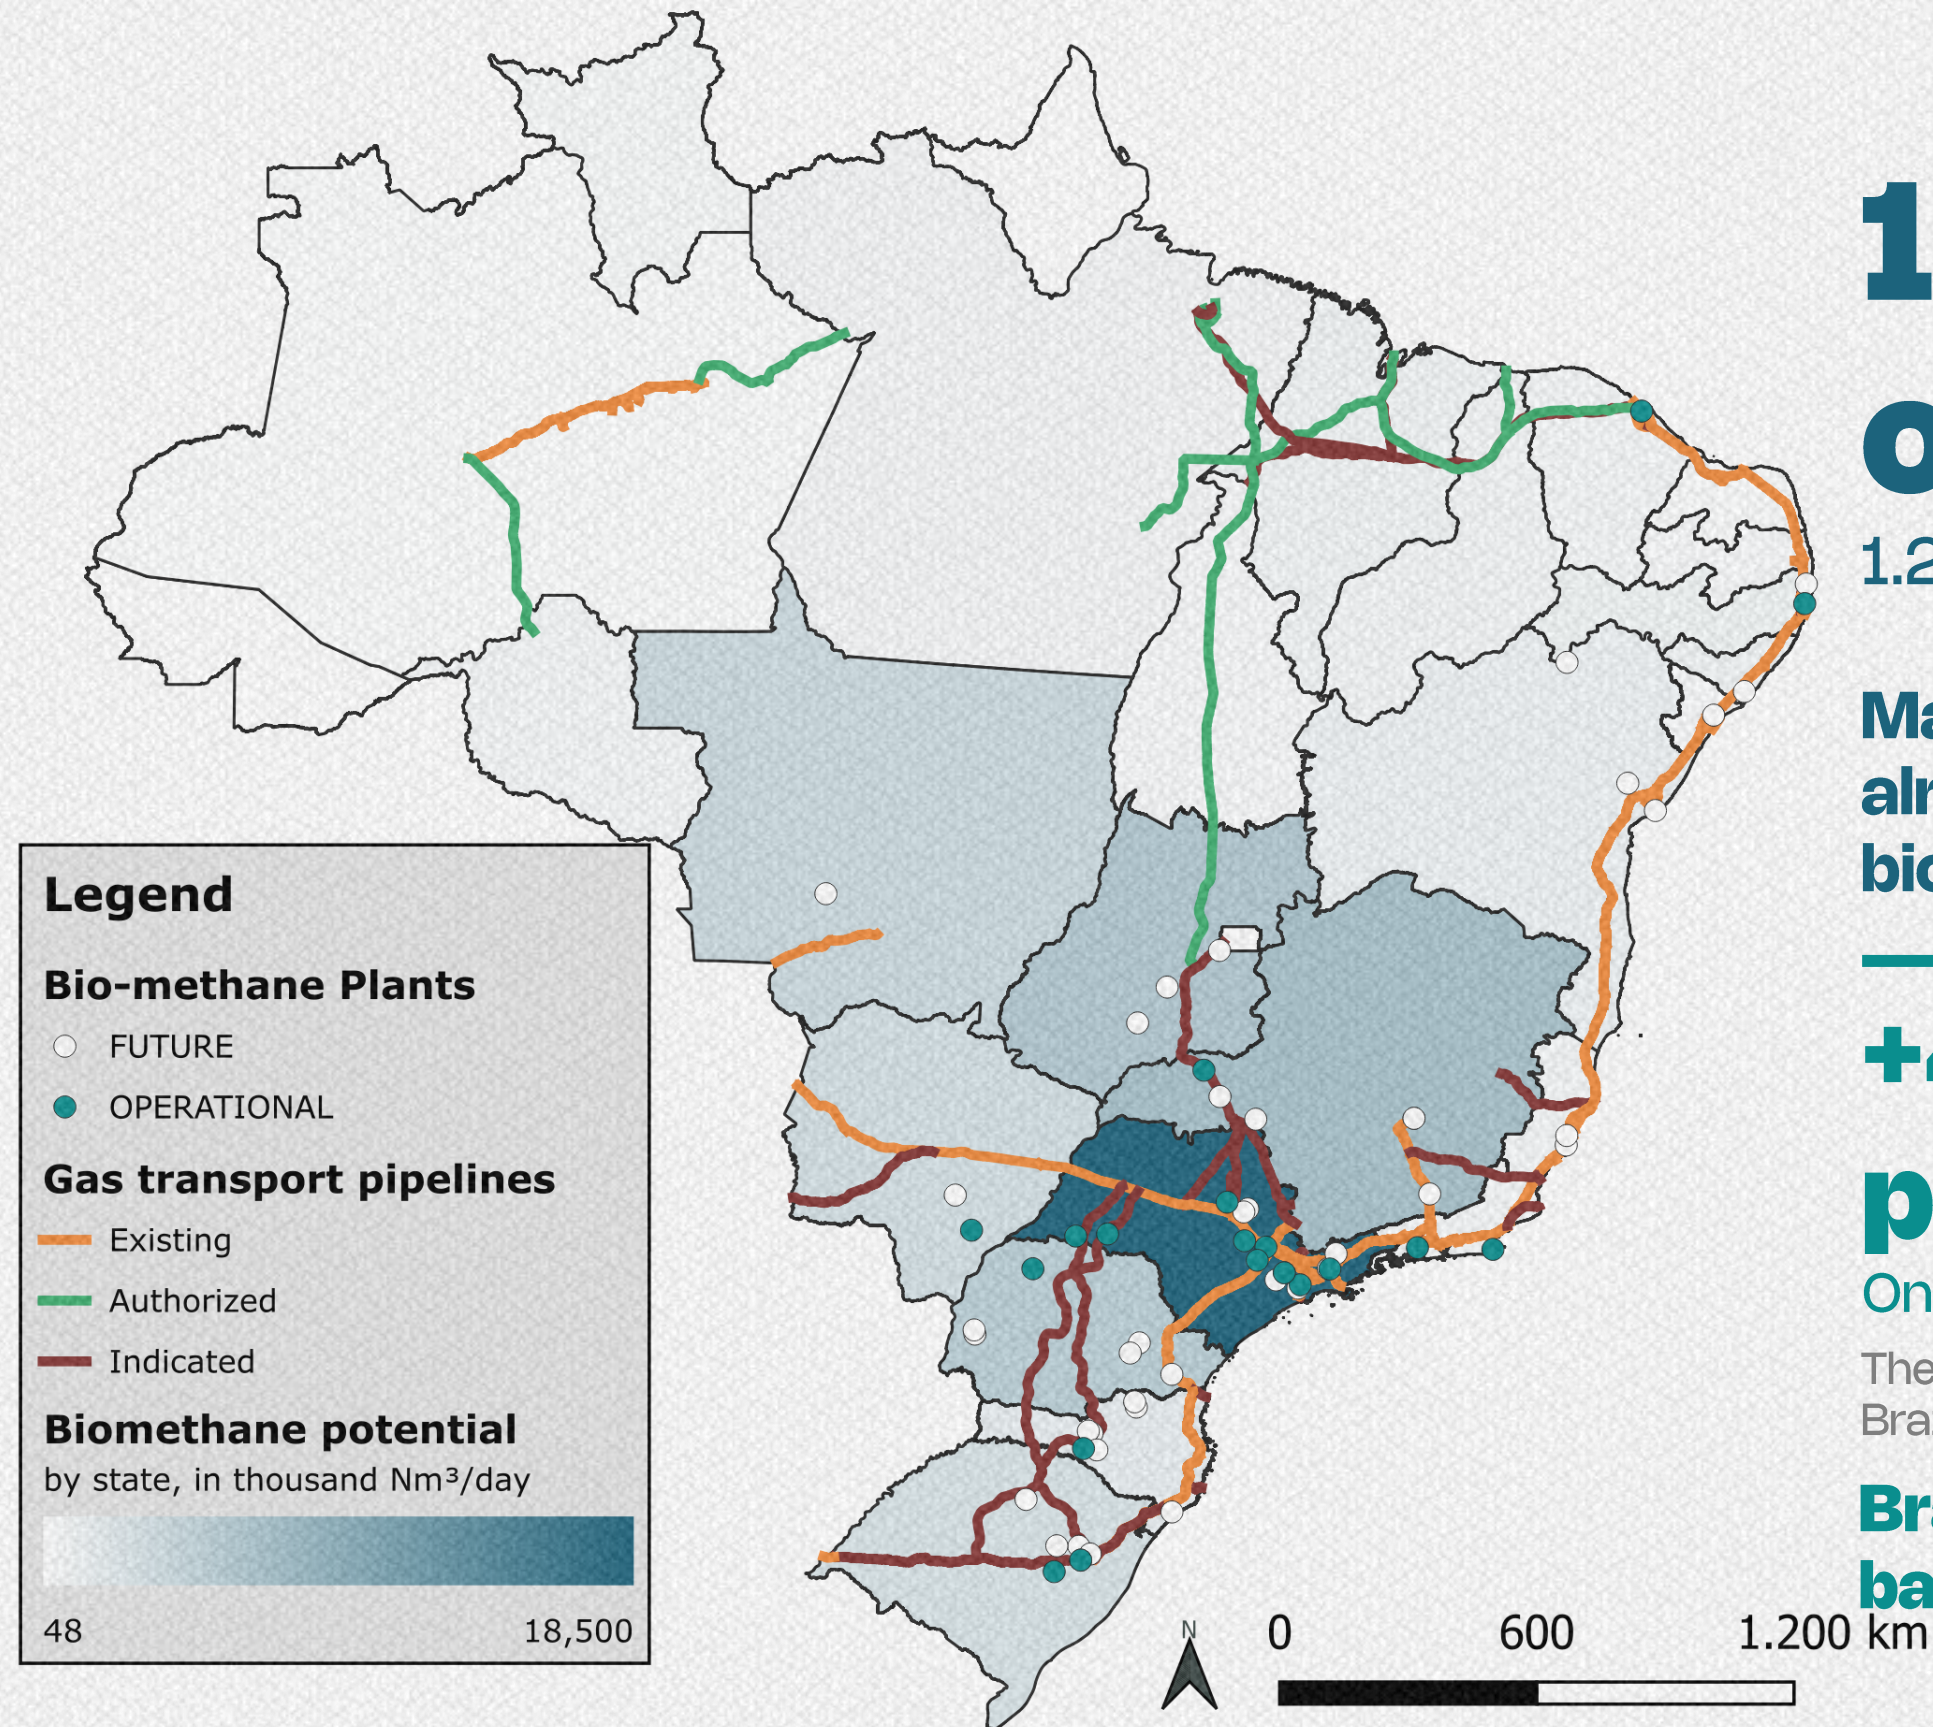

Off-gas post-treatment technologies are under development; catalysts oxidize methane, reducing methane slip by up to 98%.⁵

Boil-off gas (BOG)^a is used as fuel, reliquefied, and/or flared; avoids methane slip and increases efficiency.

^aBoil-off gas (BOG) is the methane vapor that naturally occurs since the bio-LNG/LNG is stored at -162 °C and the heat exchange with the environment makes the liquid evaporate continuously.

Brazilian biomethane pipeline

19 biomethane plants operational

1.2 million Nm³ biomethane/day – 0.3 Mt bio-LNG/year

Major players (Raízen, Cocal, São Martinho, and Geo) already use sugarcane processing residues for biomethane production.

+48 additional biomethane projects

Once operational, these projects will double the daily capacity

The map includes only plants that have already applied for authorization from the Brazilian National Agency of Petroleum, Natural Gas and Biofuels (ANP)

Brazil offers a geopolitically stable, diversified supply base for maritime bio-LNG.

Source: Data from the Brazilian National Agency of Petroleum, Natural Gas and Biofuels (ANP) SIMP Product Movement System; and Brazilian Energy Research Office (EPE)

The Brazilian regulatory scenario has changed in recent years for biomethane, enabling new investments and ensuring **financial guarantees** with new assets.

The two main assets are CGOB¹ and CBIO², which can provide revenues of up to 0.30 USD per Nm³ of biomethane.

This regulatory framework supports **guaranteed demand and long-term offtake agreements**, enabling bankable biogas project financing.

This scenario ensures an internal market and allows investments now that can be used soon to supply the maritime sector.

1. CGOB: the Brazilian government biomethane certificate of origin, its purchase is mandatory for natural gas importers and producers.

2. CBIO, the Brazilian government emissions credit, is obligatory for the transport sector

Brazil's biomethane potential enables an **unparalleled scale of production globally**. At this scale, competitive pricing becomes achievable alongside large bio-LNG volumes.

Compared with Europe plants,¹ Brazilian biomethane facilities² are, on average, 5x larger.

Considering the cost of non-compliance with the regulated market (such as FuelEU Maritime) **bio-LNG is the lowest-cost alternative fuel** through 2040 (cheaper than methanol, ammonia, and e-fuels).

Blending bio-LNG in an LNG fleet can save up to 17 million USD per year.

The **price of bio-LNG** as of 2030 is expected to be:

- Molecule (LNG): \$ 8 – 13 per MMBtu
- Premium (regulated markets): \$ 10 – 25 per MMBtu
- **Bio-LNG 100%: \$ 18 – 38 per MMBtu**
- **Bio-LNG 20%/80% Fossil LNG: \$ 10 – 18 per MMBtu or \$ 560 – 1020 per ton of blending**

Source: ¹"EBA Statistical Report 2025" from European Biogas Association (EBA), ²Data from the Brazilian National Agency of Petroleum, Natural Gas and Biofuels (ANP) SIMP Product Movement System

CERTIFICATION

Biomethane certification enables blending with fossil LNG in a **sustainable** and fully **traceable** manner.

Brazil's CGOB is being aligned with international fungibility standards.

Within fungible certificates, mass balance and book & claim are also a possibility.

Brazil already has biomethane plants that are **ISCC** and **RSB certified**.

Closing

20% of **Bio-LNG** can already be cheaper than bunker.

Brazil is uniquely capable of delivering **large-scale, low-cost bio-LNG** and low CI form agricultural residues, with **immediate compatibility with the global LNG fleet.**
